- Clear the current entry (CE) or clear all (C).
- Use memory functions to store and recall values.

Performing Basic Arithmetic Operations

1. Enter the first number of your choice (for example, 11)
2. Click the desired operator (+, -, $\times$, $\div$).
3. Enter the second number of your choice (22)
4. Press the equals (=) button to view your answer ($11 + 22 = 33$)

Using Memory Functions

Memory functions help you save a number temporarily so you can use it later without typing it again.

- **Memory Store (MS):** saves the number currently shown on the screen.
- **Memory Recall (MR):** Shows the number that was saved in memory.
- **Memory Add (M+):** Adds the current number to the number stored in memory.
- **Memory Subtract (M-):** Subtracts the current number from the number stored in memory.
- **Memory Clear (MC):** Deletes the number saved in memory.

(For example:

1. *First calculate $150 \times 4 = 600$.*
2. *Press MS to save 600 in memory.*
3. *Do other calculations if needed.*
4. *When you want to use 600 again, press MR to bring it back to the screen.)*

3.2 Scientific Mode

Scientific mode provides advanced mathematical functions used in academics, engineering and science. It includes all standard mode functions and an extended set of operations

What can you do in Scientific Mode?

- Scientific Mode allows you to perform more advanced calculations.
- Use trigonometric functions like sin, cos, and tan.
- Calculate logarithms such as log and ln.
- Work with exponential functions like e^x and 10^x .
- Find powers and roots such as x^2 , x^3 , and $\sqrt{x}$.
- Use important constants like π (pi) and e .
- Calculate factorials ($n!$).
- Use floor and ceiling functions to round numbers.
- Switch between Degrees, Radians, and Gradians for trigonometric calculations.

Using Additional Scientific Functions

1. Click the $\equiv$ menu and select Scientific.

2. Enter the number using the number pad.
3. Click the function you want to use (*for example sin, cos, log.*)
4. Press (=) if needed. (*Some functions show the result immediately.*)

2. To calculate $\log 1000$, type 1000 and click log. The answer (3) will appear.
3. To calculate $5!$ Factorial, type 5 and click $n!$ The answer (120) will appear.)

Note: Always check if the calculator is in DEG (degree), RAD (radian), or GRAD (gradian) mode before using trigonometric functions, because the mode changes the result.

3.3 Graphing Mode

Graphing Mode helps you draw graphs of mathematical equations. It allows you to see how a function looks on a graph. This is useful for studying topics like algebra and calculus.

What You Can Do in Graphing Mode?

- Enter equations and see their graphs.
- Plot more than one equation on the same graph.
- Zoom in or out to see the graph more clearly.
- Click on the graph to see the exact coordinates.
- Change the X and Y axis range to adjust the view.

3. Press Enter or click the graph icon to display the graph.
4. Use the $+$ and $-$ buttons or scroll to zoom in or out.
5. Click on the graph to see the coordinates of a point.

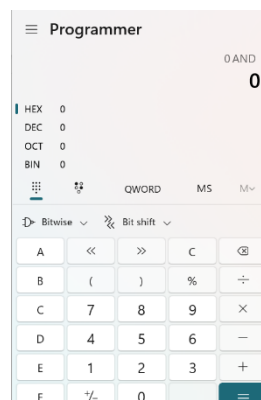

(For example,

1. To graph $y = x^2$, type x^2 and press Enter. A curved graph will appear.
2. To graph two lines, type $y = 2x + 1$ and then $y = -x + 4$. The graph will show both lines and where they meet.)

3.4 Programmer Mode

Programmer Mode is useful for people who work with computer numbers and coding. It helps you work with different number systems and special operations used in programming.

What You Can Do in Programmer Mode?

- View the binary representation of numbers.
- Switch between BYTE, WORD, DWORD, and QWORD data sizes.

Switching Between Number Systems

1. Open Programmer Mode from the ☰ menu.
2. Enter a number.
3. Click HEX, OCT, or BIN to convert the number.

(For example,

1. *To convert 255 (decimal) to hexadecimal, enter 255 in DEC mode and click HEX. The result will be FF.*
2. *To convert 1010 (binary) to decimal, click BIN, enter 1010, then click DEC. The result will be 10.)*

HEX	FF
